Plant Genetic Engineering

D. Grierson 2013-03-08 Plant biotechnology offers important opportunities for agriculture, horticulture, and the food industry by generating new transgenic crop varieties with altered properties. This is likely to change farming practices, improve the quality of fresh and processed plant products, and reduce the impact of food production on the environment. The purpose of this series is to review the basic science that underpins plant biotechnology and to show how this knowledge is being used in directed plant breeding. It is intended for those involved in fundamental and applied research on transgenic plants in the academic and commercial sectors. The first volume deals with plant genes, how they work, and their transfer from one organism to another. Authors discuss the production and evaluation of the first generation of transgenic crops resistant to insects, viruses and herbicides, and consider aspects of gene regulation and targeting of their protein products to the correct cellular location. All the contributors are actively engaged in research in plant biotechnology and several are concerned directly with its commercial applications. Their chapters highlight the importance of a fundamental understanding of plant physiology, biochemistry, and cell and molecular biology for the successful genetic engineering of plants. This interdisciplinary approach, which focuses research from traditionally separate areas, is the key to further developments which are considered in subsequent volumes. Don Grierson

Safety of Genetically Engineered Foods

National Research Council 2004-07-08 Assists policymakers in evaluating the appropriate scientific methods for detecting unintended changes in food and assessing the potential for adverse health effects from genetically
modified products. In this book, the committee recommended that greater scrutiny should be given to foods containing new compounds or unusual amounts of naturally occurring substances, regardless of the method used to create them. The book offers a framework to guide federal agencies in selecting the route of safety assessment. It identifies and recommends several pre- and post-market approaches to guide the assessment of unintended compositional changes that could result from genetically modified foods and research avenues to fill the knowledge gaps.

Genetically Engineered Crops—National Academies of Sciences, Engineering, and Medicine 2017-01-28

Genetically engineered (GE) crops were first introduced commercially in the 1990s. After two decades of production, some groups and individuals remain critical of the technology based on their concerns about possible adverse effects on human health, the environment, and ethical considerations. At the same time, others are concerned that the technology is not reaching its potential to improve human health and the environment because of stringent regulations and reduced public funding to develop products offering more benefits to society. While the debate about these and other questions related to the genetic engineering techniques of the first 20 years goes on, emerging genetic-engineering technologies are adding new complexities to the conversation. Genetically Engineered Crops builds on previous related Academies reports published between 1987 and 2010 by undertaking a retrospective examination of the purported positive and adverse effects of GE crops and to anticipate what emerging genetic-engineering technologies hold for the future. This report indicates where there are uncertainties about the economic, agronomic, health, safety, or other impacts of GE crops and food, and makes recommendations to fill gaps in safety assessments, increase regulatory clarity,
and improve innovations in and access to GE technology.

**Plant Biotechnology**-Jaime Hill 2019-01-21

Biotechnology, is the manipulation of biological organisms to make products that benefit human beings. Biotechnology contributes to such diverse areas as food production, waste disposal, mining and medicine. Plant biotechnology may be defined as the art, science and application of knowledge obtained from the study of life sciences to create technological improvements and change the genetics of plants in order to produce desired characteristics in plant species. This can be accomplished through many different techniques ranging from simply selecting plants with desirable characteristics for propagation, to more complex molecular techniques. Genetic engineering deals with synthesis of artificial gene, repair of gene, combining of DNA from two organism and manipulating the artificial gene together with the recombinant DNA for the improvement of microbes in plants as well as other living being. Genetic engineering opens a totally new dimension for bioprospecting. The search for new genes and their application is the primary objective of the biotech industry. Gene technology now enable humans to integrate revolutionary new properties in to cultivated plants through inter-specific or inter-generic gene transfer which was not possible through classical approach of crop improvement. This book covers all important aspects of practical utility in field of genetic manipulation by different areas of Plant Biotechnology Techniques.

**Genetic Engineering of Plants**-National Research Council 1984-02-01 "The book . . . is, in fact, a short text on
the many practical problems . . . associated with translating the explosion in basic biotechnological research into the next Green Revolution," explains Economic Botany. The book is "a concise and accurate narrative, that also manages to be interesting and personal . . . a splendid little book." Biotechnology states, "Because of the clarity with which it is written, this thin volume makes a major contribution to improving public understanding of genetic engineering's potential for enlarging the world's food supply . . . and can be profitably read by practically anyone interested in application of molecular biology to improvement of productivity in agriculture."

Plant Biotechnology: The Genetic Manipulation of Plants-Ava Gibson
2021-11-16 Plant biotechnology refers to the application of various principles and methods of life sciences to create improved varieties of plants. Cross breeding and mutation breeding are the most widely used practices studied under it. Modern plant biotechnology can be classified into two major fields, namely, plant tissue culture and recombinant DNA technology. In plant tissue culture, the excised part of a living plant, also known as explant, is grown in a sterile plant tissue culture medium. The joining together of DNA molecules from two different species takes place within
recombinant DNA technology. Some of the other techniques studied under it are micropropagation and genetic engineering. This book presents the complex subject of plant biotechnology in the most comprehensible and easy to understand language. Different approaches, evaluations and methodologies and advanced studies on plant biotechnology have been included herein. This book will serve as a source of knowledge to a wide spectrum of readers

Plant Biotechnology and Molecular Markers-S. Srivastava 2006-01-16
The genesis of the volume, Plant Biotechnology and Molecular Markers, has been the occasion of the retirement of Professor Sant Saran Bhojwani from the Department of Botany, University of Delhi. For Professor Bhojwani, retirement only means relinquishing the chair as being a researcher and a teacher which has always been a way of life to him. Professor Bhojwani has been an ardent practitioner of modern plant biology and areas like Plant Biotechnology and Molecular Breeding have been close to his heart. The book contains original as well as review articles contributed by his admirers and associates who are experts in their area of research. While planning this contributory book our endeavour has been to incorporate articles that cover the entire gamut of Plant Biotechnology, and also applications of Molecular Markers. Besides articles on in vitro fertilization and micropropagation, there are articles on forest tree improvement through genetic engineering. Considering the importance of conservation of our precious natural wealth, one article deals with cryopreservation of plant material. Chapter on molecular marker considers DNA indexing as markers of clonal fidelity of in vitro regenerated plants and prevention against bio-piracy. A couple of write-ups also cover stage-specific gene markers, DNA polymorphism and genetic engineering, including raising of stress tolerant plants to sustain productivity and help in reclamation of degraded land.

Plant Protoplasts and Genetic Engineering I

Y. P. S. Bajaj 2011-12-08

Isolated protoplasts are a unique tool for genetic manipulation of plants. Since the discovery of a method for the enzymatic isolation of protoplasts by Professor E. C. Cocking in 1960, tremendous progress has been made in this very fascinating area of research. I have witnessed the struggle in the 1960's and early 1970's, when obtaining a clean preparation of protoplasts was considered an achievement. I also shared the pioneering excitement and enthusiasm in this field during the 2nd International Congress of Plant Tissue Culture held at Strasbourg in 1970, where Dr. I. Thkebe of Japan presented his work on the induction of division in tobacco protoplasts. This was followed by my participation in three international conferences devoted to plant protoplasts held in 1972 in Salamanca (Spain) and Versailles (France), and then in 1975 in Nottingham (England). The enthusiasm shown by plant scientists at these meetings was ample proof of the bright future of protoplast technology, and it became evident that protoplasts would play a major role in plant biotechnology, especially in genetic engineering. Since then we have never looked back, and now the methods for isolation, fusion, and culture, as well as regeneration of somatic hybrids, have become routine laboratory procedures for most plant species. Currently the focus is on cereal and tree protoplasts. In order to bring about any genetic manipulation through fusion, incorporation of DNA, and transformation, the regeneration of the entire plant through manipulation of protoplasts is a prerequisite.

**Plant Tissue Culture and Transformation Techniques** - Balram Sharma
2008 This publication deals with various aspects of the genetic engineering-plant tissue culture and transformation techniques. Due to their biological, ecological and geographic diversity, the demand for various horticultural crops is likely to increase manifold in the future and in order to meet such demand, there is an urgent need to concentrate on the research aspects for improvement of these crops. Plant tissues culture offers new tools to accomplish this objective. Plant tissue culture is an important area of biotechnology, which is used for the propagation of problem-species, rapid propagation of high value genotypes, production of secondary metabolites etc. Tissue culture is an important step in developing new hybrids from distant parents and transgenics and particularly cost-effective technology with palpable impact in vegetatively propagated plants, which is clearly visible in improved yields of cultivars incorporating genes from unexplored sources and improved germplasm, enhancement of quality parameters and supply of disease-free clones of true-to-type planting materials. Plant tissue culture is the most rapid and efficacious way to speedy production of large volumes of identical plants for specific markets.
Micropropagation is the quickest way for popularization of new varieties of horticultural crops where other methods of mass multiplication of genetically pure and homogeneous planting materials are very slow. With the advent of transformation technology, it has become a useful tool to mass produce new plants with genetic material transferred from unrelated sources with the help of tissue culture. The volume contains contributions by several authors highlighting the status of genetic engineering and plant tissue culture research and development programmes in various developing countries and case studies on a few economically important crops. The publication will be of immense value to the working scientists, institutions, policy makers and all those bearing responsibility to develop, implement and intensify programmes in the related subjects in their respective countries. This book provides a good picture of efforts being made and success already achieved in the Third World countries at various levels of development striving to secure gains from the latest advances in science and technology. **Plant Protoplasts and Genetic Engineering II**-Y. P. S. Bajaj 2012-01-10 Genetic engineering through DNA recombinants and the in vitro manipulation of isolated protoplasts has recently attracted much attention in agricultural biotechnology,
and has greatly advanced during the last 5 years. In an earlier book, Plant Protoplasts and Genetic Engineering I, methods for the isolation, fusion and culture of protoplasts were reviewed and the regeneration of complete plants from isolated protoplasts of rice, potato, soybean, linseed, cabbage, chicory, lettuce, but terbur, orchids, citrus and some other tree species, and interspecific and intergeneric somatic hybrids in Lycopersicon, Petunia, Nicotiana, Solanum, Glycine, Citrus, Brassica, Medicago and Trifolium spp. were discussed. The present volume, Plant Protoplasts and Genetic Engineering II, deals with some of the newer techniques such as microinjections, electrofuson, flow cytometry, uptake and integration of DNA, nuclei, isolated chromosomes by plant protoplasts and the subsequent regeneration of transgenic plants. The literature on the DNA recombinants and genetic transformation, both Agrobacterium-mediated and direct gene transfer in agricultural crops and trees, such as poplars, is reviewed, and the uses of cytoplasts and miniprotoplasts in genetic manipulation are highlighted.

**Modern Applications of Plant Biotechnology in Pharmaceutical Sciences**

Saurabh Bhatia 2015-07-22

Modern Applications of Plant Biotechnology in Pharmaceutical Sciences explores advanced techniques in plant biotechnology, their applications to pharmaceutical sciences, and how these methods can lead to more effective, safe, and affordable drugs. The book covers modern approaches in a practical, step-by-step manner, and includes illustrations, examples, and case studies to enhance understanding. Key topics include plant-made pharmaceuticals, classical and non-classical techniques for secondary metabolite production in plant cell culture and their relevance to pharmaceutical science, edible vaccines, novel delivery systems for plant-based products, international industry regulatory
Biotechnology and Plant Biology - Harley Macdonald & Donovan Stevens 2019-09-03

The term biotechnology refers to any technology, process or practice that modifies or harnesses any living organism or system to be useful to any human purpose. Plant biotechnology is essentially genetic engineering related to botanical science. Botany, branch of biology that deals with the study of plants, including their structure, properties, and biochemical processes. Also included are plant classification and the study of plant diseases and of interactions with the environment. The principles and findings of botany have provided the base for such applied sciences as agriculture, horticulture, and forestry. Modern biological systematics integrates a diverse array of disciplines ranging from molecular, cell and developmental biology, to ecology and evolutionary biology. Data-gathering techniques include DNA sequencing, protein electrophoresis, electron and light microscopy, controlled growth experiments, and field studies of ecology and distribution. The present book will be useful for the researchers to update their information on the topics dealt within this book. Book will be also useful to students, teachers, and, researchers in the field of biotechnology and plant biology. This book provides excellent glimpses on the current trends of plant biology.
